

Lab 1.0

SETTING UP PYTHON

I. Setting Up Anaconda

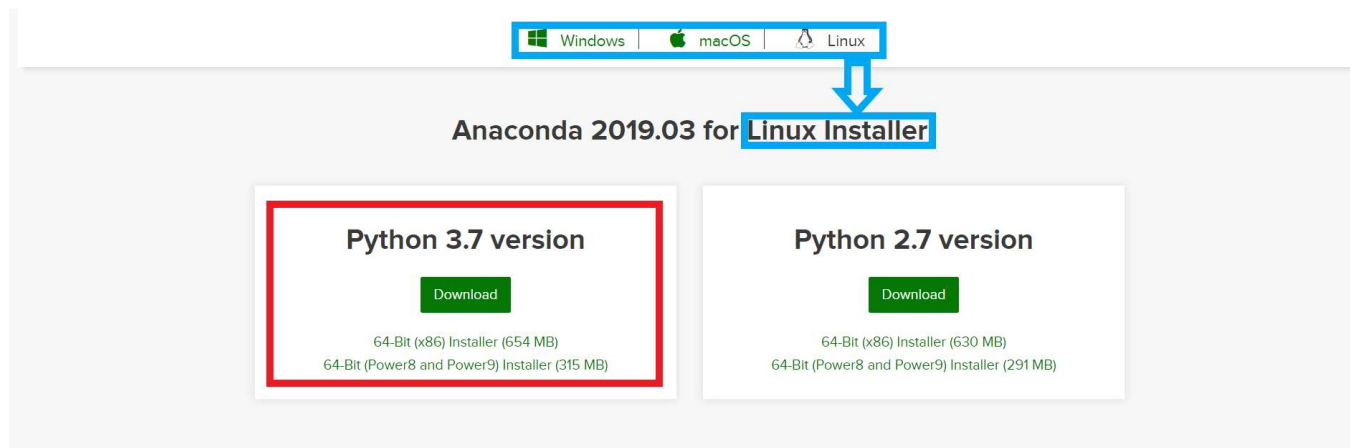

Anaconda is a Python distribution. It provides the Python language, packages, and package management. Overall, Anaconda makes Python easier to use. When you install Anaconda, you will also install Python.

This section of the lab provides step-by-step instructions for getting started with Anaconda. If you would like, there is also a video at the end of the section that will walk you through the same steps that can serve as a resource as well.

I. Setting Up Anaconda

1. Downloading Anaconda

- Open <https://www.anaconda.com/distribution> .
- In the middle of the page, choose your operating system (Windows, Mac, Linux - boxed in blue below). Make sure that the correct operating system is selected before downloading Anaconda.
- Click the "Download" button for the Python 3.7 version (boxed in red).

I. Setting Up Anaconda

2. Installing Anaconda

- Click the link from the list below for your operating system (Windows, Mac, or Linux). This will take you to the documentation for installing Anaconda. You have already completed Step 1 in this documentation by downloading Anaconda. Follow the rest of the directions carefully. You do not need to complete the optional steps, but be sure to complete step 15 to ensure that Anaconda was installed correctly.
 - Windows: <http://docs.continuum.io/anaconda/install/windows/>
 - Mac: <http://docs.continuum.io/anaconda/install/mac-os/>
 - Linux: <http://docs.continuum.io/anaconda/install/linux/>
- If you would like, you can also follow along with this video.
 - Note: If you are on Windows, you can use Anaconda Prompt instead of Windows Command prompt as he does in the video.

II. Getting Started with Jupyter Notebooks

Jupyter Notebooks are a way to write and run Python code. By installing Anaconda, you have access to Jupyter Notebooks. They allow you to break up code into "cells" and run these cells individually.

This section of the lab will help you get started with accessing, creating, and running Jupyter Notebooks.

II. Getting Started with Jupyter Notebooks

1. Accessing Jupyter Notebooks

- Unix Shell
 - We will use basic Unix Shell commands to open Jupyter Notebooks. If you are new to the Unix Shell, see this tutorial for learning about the Unix Shell: <http://swcarpentry.github.io/shell-novice/> .
 - For a summary of the key points of the Unix Shell, see <https://swcarpentry.github.io/shell-novice/reference/> .
 - To navigate around the Unix Shell, these are the commands that you will need:
 - *cd path* changes your directory
 - *ls path* lists your directory
 - *cd ...* moves back a directory
 - For a complete list or further explanation: <https://swcarpentry.github.io/shell-novice/reference/> .

II. Getting Started with Jupyter Notebooks

1. Accessing Jupyter Notebooks

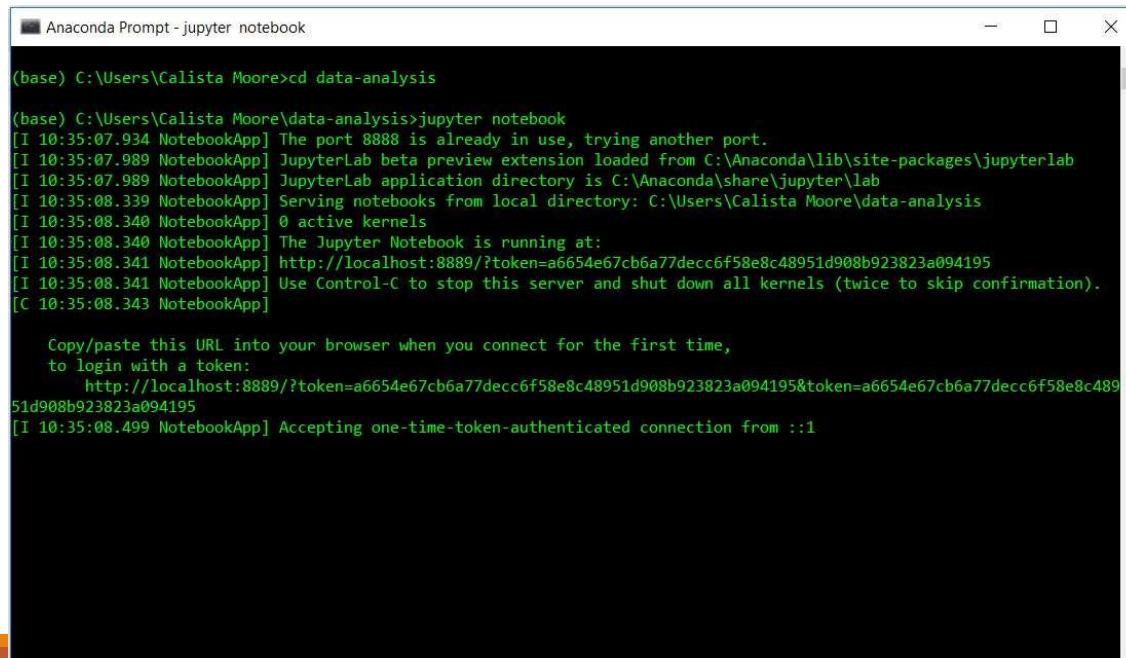

- Creating/Opening Jupyter Notebooks

- Create a folder that you will store all files for this class. For ease of access, I recommend creating the folder under "Windows (C:)" then "Users" then "*Your Username*". Do not include spaces in the name of your folder. I named my folder "data-analysis".
- Search "terminal" or "anaconda prompt" in your computer's searchbar to find the Command Prompt or Anaconda Prompt. Open one of these programs.
- Navigate to the folder that you created in step one using the commands provided above in the "Unix Shell" section.

II. Getting Started with Jupyter Notebooks

1. Accessing Jupyter Notebooks

- Your command prompt should look something like this:

```
Anaconda Prompt - jupyter notebook

(base) C:\Users\Calista Moore>cd data-analysis

(base) C:\Users\Calista Moore\data-analysis>jupyter notebook
[I 10:35:07.934 NotebookApp] The port 8888 is already in use, trying another port.
[I 10:35:07.989 NotebookApp] JupyterLab beta preview extension loaded from C:\Anaconda\lib\site-packages\jupyterlab
[I 10:35:07.989 NotebookApp] JupyterLab application directory is C:\Anaconda\share\jupyter\lab
[I 10:35:08.339 NotebookApp] Serving notebooks from local directory: C:\Users\Calista Moore\data-analysis
[I 10:35:08.340 NotebookApp] 0 active kernels
[I 10:35:08.340 NotebookApp] The Jupyter Notebook is running at:
[I 10:35:08.341 NotebookApp] http://localhost:8889/?token=a6654e67cb6a77decc6f58e8c48951d908b923823a094195
[I 10:35:08.341 NotebookApp] Use Control-C to stop this server and shut down all kernels (twice to skip confirmation).
[C 10:35:08.343 NotebookApp]

Copy/paste this URL into your browser when you connect for the first time,
to login with a token:
http://localhost:8889/?token=a6654e67cb6a77decc6f58e8c48951d908b923823a094195&token=a6654e67cb6a77decc6f58e8c48951d908b923823a094195
[I 10:35:08.499 NotebookApp] Accepting one-time-token-authenticated connection from ::1
```

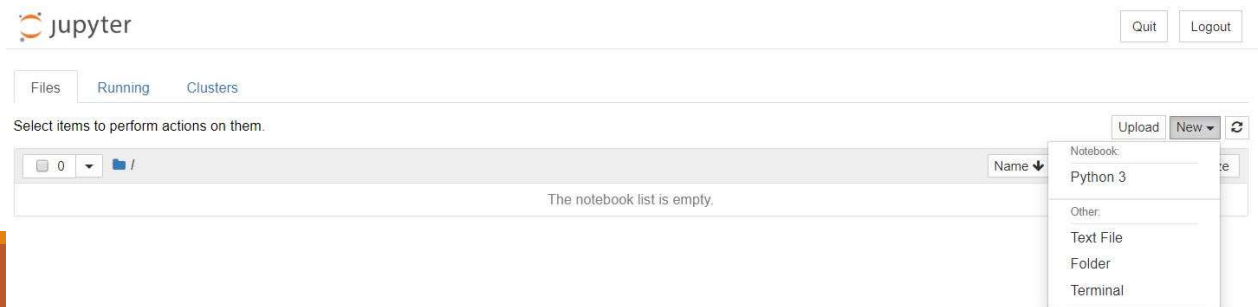

II. Getting Started with Jupyter Notebooks

1. Accessing Jupyter Notebooks

- A tab with the Jupyter interface will open in your browser.

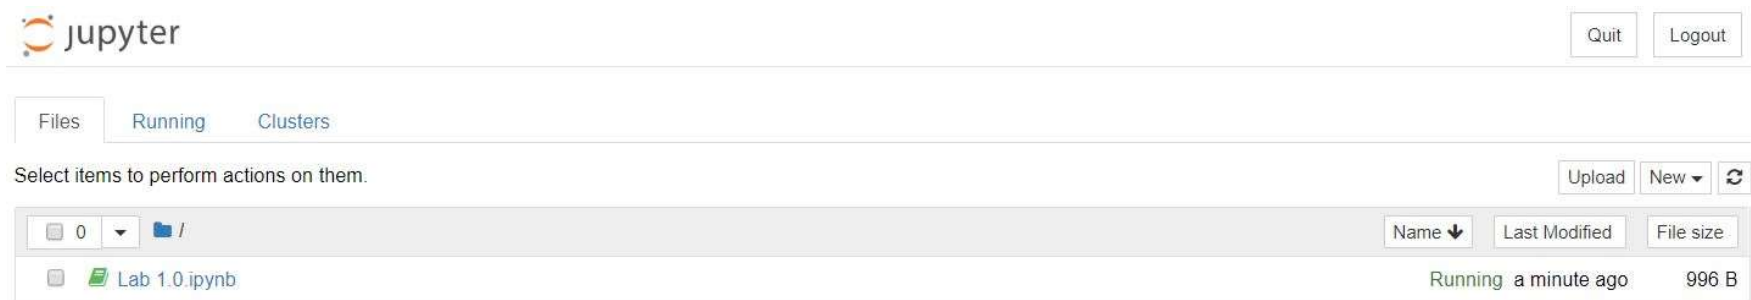

- Create a new Jupyter Notebook by selecting "New" in the upper right hand corner and then "Python 3".

II. Getting Started with Jupyter Notebooks

1. Accessing Jupyter Notebooks

- You have now created a Jupyter Notebook which you can run Python code in. The next labs will provide you with some basics of Python coding. See the "Resources to Learn Python Programming" for more, including tutorials, glossaries, and documentation.
- To close the Jupyter Notebook and the interface, close the tab with the Jupyter Notebook and select "Quit" in the upper right hand corner of the interface page. You can now also close the Anaconda Prompt or terminal.

II. Getting Started with Jupyter Notebooks

2. Running Jupyter Notebooks

- More on running Jupyter Notebooks will be covered in future labs. If you would like an overview of how Jupyter Notebooks run/work, this article provides some information: <https://www.codecademy.com/articles/how-to-use-jupyter-notebooks-py3>
